Public Services Accounting Structures Use Case -- Updating SAP for Public Sector with an Accounting Structure Element in a Third-Party System

This use case describes one of the ways that the services in the Public Services Accounting Structures ES bundle could be used; for the sake of a concrete example, we describe the use case from the standpoint of a city public works department's playground refurbishment project.

Third-party systems might be used for planning projects, and this use case describes how data can be transferred from such systems to SAP for Public Sector using enterprise services.

The finance department might use a third-party system to do detailed project planning for the playground refurbishment project. In the third-party program, the user can set up a project including a project plan, milestones, deliverables, and so on. Once finished, the employee sets a "project setup complete" flag which triggers the third-party project to analyze which objects are in use, calls a service to find if these objects exist, and if not, calls another service to have them created in SAP for Public Sector.

For More Information
If you want to learn more about this ES bundle, see Public Sector Accounting Structures.
